Subject = 'DBMS'

Typically, each Block performs a logical action in the program. A Block has the following structure

DECLARE

declaration statements;

BEGIN

executable statements

~~Exception~~

EXCEPTION

exception handling statements

END ;

→ Declare section start with DECLARE keyword in which variables, constants, records or cursors can be declared which stores data temporarily. It

basically consists of definition of PL/SQL

Identifiers: This part of the code is optional

⇒ Execution section start with BEGIN and ends with END keyword. This is a mandatory section and here the program logic is written to perform any task like loops and conditional statements. It support all DML and commands, DDL command and SQL * PLUS Built-in function as well.

⇒ Exception section starts with EXCEPTION keyword. This section is optional which contain statement that are executed when a run-time error occurs. Any exceptions can be handled in this section.

PL/SQL Identifiers

There are several PL/SQL Identifiers such as Variable, Constants, Procedures, Cursor, Triggers etc.

PL/SQL Variable

A variable is nothing but a name given to a storage area that our programs can manipulate. Each variable in PL/SQL has a specific

data type, which determines the size and the layout of the variable's memory; the range of values that can be stored within that memory and the set of operation that can be applied to the variable.

The name of PL/SQL variable consists of a letter optionally followed by more letters, numerals, dollar sign, underscores and number sign and should not exceed 30 characters. By default, variable names are not case-sensitive. you cannot use a reserved PL/SQL keyword as a variable name.

PL/SQL programming language allows to define various types of variables such as date, time, data type, records, collections etc.
